Summary

Dedicated Full Stack Developer with 10+ years of experience specializing in Ruby on Rails, React.js, and scalable application architecture. Proven track record in optimizing infrastructure, enhancing security, and leading development on high-availability systems. Proven ability to lead end-to-end development, optimize infrastructure, and ensure system availability. Passionate about the clean code, system design, namespaces and that create applications without breaking them.

Skills

- Ruby, Javascript, Typescript, Postgres, MySQL, Redis, NoSQL, Docker, Lambda, Git, AWS
- Ruby on Rails, Hotwire, Sidekiq, RSpec, CI/CD, OOP, FP, System Design and Architecture
- Monolith, Microservices, Design Systems, Backend, Frontend, English, Portuguese

Experience

Senior Software Engineer (Rails & AWS)

Atende Simples

Full Remote - April 2018 - Present (2025)

Technical Achievements

- I migrated our WebService (using Sinatra) from Heroku to AWS EC2. I've used Dokku to create a pipeline deployment. Similar to Heroku, actually based on Heroku, Dokku can send our app rapidly to the EC2.
- I projected several real-time dashboards using Rails, React.JS and Ably(websocket)
- I added a encryption to our requests using Branca Encryption (Rails) improving our security in 100%
- I designed and built a auditable module data for all controllers (Rails)
- Applied Reduce Background Noise to our WebRTC VoIP application, using AudioWorkLet and RNNoise.
- I implemented a feature called the Power Dialer to send almost 1000 calls per second, using AWS SNS, AWS SQS, AWS Lambdas, Redis and TypeScript
- Ensured 100% uptime of core Rails application through proactive monitoring, failover mechanisms, and performance tuning
- Created a system design for our React.JS components.
- Responsible for migrate a bunch of endpoints from Heroku (Rails) to AWS (Lambdas) and reduce our costs in 45% in the AWS using caching, idempotency and etc..
- Migrate background processes from Heroku (Clockwork + Sidekiq) to AWS Lambda Schedules.
- Guarantee that our code had 100% failure tolerance
- Created a logical structure for our microservices using ServerlessFramework, Vitest, RSpack, TypeScript, separating for modular folders.
- Created our own shared libraries, separating a lot of potencial libraries to own workflow
- Responsible to create a new full features in the Rails application.
- Improvement performance in the many Rest APIs, using cache, idempotency and jobs to respond to our customers the faster way.
- Implemented React.JS in the front-end, in order to our pages become more asynchronous.
- Fixed our build assets, using webpacker and sprockets together.
- Responsible for maintain our WebRTC VoIP applications, creating new features, fixing bugs and improvement UX/UI for our customers.

Notable Achievements

- When we migrate our old WebService to a new infrastructure, we achieved a 50% performance increase and reduced 10% of our costs in the infrastructure and the better we could continue using Sinatra(Ruby)
- Applying the RNNoise to our WebRTC VoIP, helped the our customers communicate with their customers so better.

- Improved API response times by implementing caching and asynchronous job processing
- Reduced AWS infrastructure cost by 45% via migration to Lambda, caching, and efficient logging strategies.
- Help my coworkers to understand about System Design, OOP and Funcional Programming using Ruby, NodeJS and TypeScript.
- Collaborated with product team to reach out our goal in the year.
- Helped my coworkers in the Code Reviews, Daily's and Trade Offs in the Slack Channel

Technologies

- OOP, SOLID, Sinatra, Ruby on Rails, RSpec, RedisStack, TypeScript, Heroku, Dokku, Ably, WebRTC
- ReactJS, PreactJS, PostgreSQL, Sidekiq
- AWS Lambda, AWS Dynamo, AWS SQS, AWS SNS, AWS S3
- WebRTC VoIP (using SIP.js), Preact.JS, unistore, redux, localStorage, IndexedDB and more

Ruby on Rails Developer **Prefeitura Municipal de Palmas** Palmas - Tocantins, Brazil - June 2017 - March 2018

Technical Achievements

- Systems of Health Notifications
- The small application system using Rails, that monitoring sickness around the city. Creating a measures about that which types of sickness the people had.
- Systems of Vaccine
- The small application system using Rails, that created a stock vaccine. In order to control when they need to get more them.
- Systems of Leprosy (Hansens)
- The medium application system, super easy, to register the patient and then created a timeline to your life. Luckily that system was very cool. Very used for many people around the city. Certainly help a lot of people about your sickness. Also it controlled vaccine, appointment schedules, informations, notifications and much more.

Technologies

- Ruby on Rails, PostgreSQL, Sidekiq
- React.JS, SCSS, ClockWork, Docker on Debian Server

Ruby on Rails Developer **ConsistI** Palmas - Tocantins, Brazil - September 2015 - June 2017

Technical Achievements

- Development of the web application in Ruby on Rails and Symfony 2 Framework.

Notable Achievements

- I'd started to programming using Ruby on Rails to create sites and applications to our customers. Indeed we our started to get more clients
- Symfony2 Framework to more complex applications
- JavaScript to make dynamic and interactive applications
- CSS to design systems to our web systems and web sites.

Note: If you want to see more about my professional career, you can check my LinkedIn [thadeuestevesjr](#)

Certifications

- AWS Certified Cloud Practitioner - Foundational
- Redis University Certification Developer

Projects

Branca Ruby

<https://github.com/thadeu/branca-ruby>

This gem provides a Branca implementation for Ruby. Encrypt using **IETF XChaCha20-Poly1305 AEAD symmetric encryption**.

VSCode Run RSpec File Extension<https://github.com/thadeu/vscode-run-rspec-file>

This extension provides basic commands for running spec files in build-in vscode terminal. Basically it can reduce your time to run rspec files more easily rather than typing the command manually.

Vitest LocalStack<https://github.com/thadeu/vitest-localstack>

A simple way to testing AWS Services using Vitest and JavaScript. You can mock AWS services and test your code in a fast and efficient way. Reducing your cost with AWS drastically.

Note: If you want to see more projects you can check my GitHub <https://github.com/thadeu>
